EXPERIMENT 11

Deploying a Zoho Creator Application from Development to Production Environment

Library Book Issue Request Form (Deployment & Lifecycle Management Use Case)

RAMANATHAN S
241401076

1. Aim

To deploy the Library Book Issue Request Form application from the Development environment to Stage for thorough testing, and subsequently to Production, ensuring tested versions reach end users safely without disrupting live operations.

The experiment covers environment separation, application packaging, component promotion, user acceptance testing (UAT), version control, rollback planning, and live publishing.

2. Procedure

Step 1: Set up environment architecture. Configured separate Development, Stage, and Production environments within Zoho Creator to maintain clean boundaries between active building, testing, and live user access.

Step 2: Prepare application components for release. Audited all forms, reports, workflows, and custom Deluge scripts in the Development environment to ensure stability and completeness before migration.

Step 3: Promote to Stage environment. Migrated the application package from Development to Stage, validating that connections, permissions, and custom functions mapped correctly.

Step 4: Conduct User Acceptance Testing (UAT). Executed rigorous test cases on Stage, simulating student book requests and librarian approvals to verify end-to-end functionality.

Step 5: Execute Production deployment. Promoted the verified application package to Production and published the live user portal.

Step 6: Establish post-deployment monitoring. Monitored system logs, user access performance, and error notifications following the Production release.

Note: This is a structured deployment lifecycle exercise. Actual promotion steps follow Zoho Creator's application publishing and environment migration guidelines.

3. Output

3.1 Deployment Pipeline Stages

The structured promotion pipeline ensures zero data corruption and clean separation of duties between developers and administrators:

Environment	Purpose	Target Users	Access Level
Development	Active building, script testing, and form layout design.	Developers / Builders	Full Edit Access
Stage	User Acceptance Testing (UAT) and validation.	Testers / Stakeholders	Read / Test Access
Production	Live operational usage by end users.	Students & Library Staff	Restricted Live Access

3.2 Version Control and Rollback Strategy

To guard against unexpected script failures or workflow breaks in Production, version snapshots are archived prior to each promotion. If an error occurs post-deployment, administrators can quickly revert to the previous stable application state without data loss.

241401076

3.3 Post-Deployment Audit & Access Verification

Following live publishing, role-based permissions were re-verified in Production. Student accounts successfully submitted book issue requests, while librarian dashboards correctly reflected pending approvals without unauthorized cross-role access.

4. Final Result

Successfully planned and executed the end-to-end deployment lifecycle for the Library Book Issue Request Form application in Zoho Creator, moving smoothly from Development through Stage testing to live Production deployment.
